"The Autopsy Method of Diagnosing the Acid-Base Balance Troubles in the Course of Chronic Respiratory Failure"

Warszawa, Polskie Towarzystwo Lekarskie, Vol XXVII, No 5, 26 Jan 1963, pp 187-194

Abstract: "Authors' English summary modified." The determinants of blood pH, partial CO₂ pressure and bicarbonatemia resulting from the method of autopsy is reported. Their patients were examined by this method. Its value for the diagnosis and treatment of troubles in acid-base balance in chronic disease of the lungs is assessed. 4 diagrams; 6 literature references; 1 gray, 3 Western and Polish sources.

Radwan M., Owczarski T. Methods of Radiographic Inspection of High Pressure Pipe Welds.

"Metody radiologicznej kontroli spoin rurociągów wysokiego ciśnienia". Przegląd Spawalnictwa. No. 5, 1955, pp. 113-120, 15 figs.

The Industrial Radiology Department of the Electrotechnical Institute has worked out methods of making radiographs from high pressure pipe welds. According to the diameters of pipes, various methods have been used for making radiographs and in particular: 1) for pipes over 40 mm. in diameter when it is possible to insert the target of the X-ray tube into the pipes -- the revolving method; 2) for pipes of over 400 mm. in dia. and wall thickness of over 20 mm when the exposure-hol-

der can be inserted into the pipes -- the single wall method; 3) for pipes of 100 to 400 mm. in dia. when it is impossible to insert the exposure-holder into the pipes -- the double wall method; 4) for pipes under 100 mm. in dia -- the method of elliptic projection. Existing inspection rules for pipe welds, made according to Soviet standards, are discussed on the basis of radiographs.

RADWAN, MACEJ

Theoretical and experimental determination of the resolution of defects in radiographic examination by means of γ -rays from Co^{60} . Maciej Radwan. *Jaderná energie* 9, 10-17 (1967).—The limit of resolution of a defect in a metal is shown to depend on the apparent absorption coeff. of the radiation in the metal and on the sensitivity and contrast of the x-ray film. The former can be detd. either theoretically or exptl., but the latter only exptl. The calcd. value for the absorption coeff. of Co^{60} γ -rays in Fe is somewhat higher than the observed. This may be due to scattered radiation, and to lack of sharpness of the image owing to the large size of the sample compared to the focal distance. The relative limit of resolution (in % of the thickness of sample) decreases when the thickness increases and when the distance between the source and the sample increases.

autoradiography

SOURCE: Nukleonika, v. 10, no. 1, 1965, 62-66

TOPIC TAGS: autoradiography, radioisotope, beta spectrum

ABSTRACT: This laboratory communication reports on the determination of samples for autoradiograms. The maximum permissible thickness of the polished sample was determined at which the radiation coming to the film from the farthest layers gives a blackening similar to the background blackening. The photographic densities were measured for nine radio-isotopes of pure elements, four of which have simple beta-radiation spectra (Co-60, Tl-204, Zn-69, P-32); the spectra of the others are composite. The autoradiograms were made with the same exposure time, the samples were in direct contact with the film emulsion or were wrapped in aluminum -foil filters of varying thickness. On this basis it was possible to obtain density curves (% blackening versus filter thickness) corrected for errors

TITLE: Indirect method determining the contamination of ground with fall-out

SOURCE: Nukleonika, v. 10, no. 2, 1965, 123-130

TOPIC TAGS: strontium, isotope, radioactive contamination, radioactive fallout

ABSTRACT: The concentration of strontium-⁹⁰ in horns of stags derived from various places and several years was investigated. Pieces of horns were burned and samples were prepared from ash. The activity of those specimens (dry and liquid) was measured by use of several counters. It was found that the concentration of strontium-90 in horns grows with time. This can be taken as a criterium of ground contamination by fallout. Orig. art. has 2 tables and 1 graph.

TITLE: Influence of flaw shape and radiographic technique on the detectability in
isotope radiographic methods 19

SOURCE: Nukleonika, v. 10, no. 3, 1965, 145-153

TOPIC TAGS: radiography, flaw detection, isotope, photometer

ABSTRACT: The influence of the radiographic technique on detectability of different shapes of flaws was studied. The theoretical analysis of the change of density for radiographic images of flaws made it possible to determine decreases in density above the background. Measurement and photometric analysis of density curves for images of flaws were obtained by using an automatic recording photometer. A strong relation was observed between the radiographic technique and the image density curve. By using the density curves it should be possible to determine the kind of flaw. Orig. art. has:

in Metallic Calcium.

Orig Pub : Chem Analit, 2, No 3, 245-248 (1957) (in Polish with Summa-
ries in English and Russian)

Abstract : A simple and rapid method has been developed for the deter-
mination of Li; the method is applicable to the analysis
of samples which do not contain K. Procedure: 0.5 gm of
the calcium to be analyzed is treated with water, the solu-
tion is evaporated, and the residue is ground in a mortar.
About 0.05 gm of the substance obtained is placed in the
hollow tip of the bottom electrode. Cu-electrodes are
used: the lower electrode has a diameter of 6 mm with an
opening 5 mm in diameter and 5 mm in length. The spectra

openings of 0.8 mm diam. The lower Cu electrode of 5 mm diam is provided with a flat end. When the arc is turned on the powder is sifted for 45 sec into the analytical slit [Interelectrode distance?]; in the course of the analysis 50% of the powder evaporates in the arc. The coal dust prevents the powdered ore from fusing together in the channel of the electrode. The spectra are recorded with a type ISP-51 glass spectrograph, using a UF-84 camera with a slit width of 10 μ . In order to avoid the superposition of the CN band on the U 4090.14 Å line, the electrodes are placed in a glass chamber through which a 1 : 1 mixture of Ar and O₂ is passed at a rate of 3 liters per min. TITLE: The spectral determination of trace quantities of rare earth elements by a fractional distillation method

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24, 1962, 232, abstract 24D101 (Chem. analit. (Polska), v. 6, no. 6, 1961, 959-967 [Pol.; summary in Eng.])

TEXT: A method of spectral determination of Eu, La, Y, Nd, Pr, Sm in 5 N HCl solutions is described. The solution to be analyzed, with a volume 2 ml + 1 ml Zr(NO₃)₄ solution containing 10 ppm Zr, is evaporated at 200° with 1 g powdered graphite. 2% CsF as carrier is then added to the powder and the mixture is ground in an agate mortar for 20 min. A sample (40 mg) is placed in the channel of a graphite electrode 8 mm deep and 3.2 mm in diam. The upper electrode terminates in a cone (20°). The spectra are excited in a d-c arc (6 a) with anode operation. The electrode spacing is 5 mm. The spectra are photographed for 15 sec with a mixture of 80%

O_2 + 20% Ar at a pressure of 60 mm water col. flowing through the spark gap. An MCA-51 (ISP-51) spectrograph with a UF-84 (UF-84) chamber is used for recording the spectra. Width of slit 15μ . Spectral lines: Eu 3907.11, La 3949.11, Y 3950.36, Nd 4012.25, Pr 4222.98, Sm 4280.78 Å. Comparison line Zr 3991.15 Å. Absolute sensitivity of the method $2 \cdot 10^{-2}$ g La and Y, $4 \cdot 10^{-2}$ g Eu, Pr, Nd and Sm. Reproducibility of the results ~12%.

PEDIAT. POL. 1957, 32/2 (203-208)

A detailed description is given of conditions favourable for the development of iron deficiency. It is known because of the investigations of Swiss authors that iron deficiency in adults may appear in a disguised form without anaemia. The possibility is suggested of the existence of disguised iron deficiency in children and the opinion expressed that as there is no standard of haemoglobin and erythrocytes quantity for small children, it is impossible to recognize cases of disguised iron deficiency.

AUTHOR: Radwanski, Edward (Master engineer)

TITLE: Problems of heat exchange at high velocities and high altitudes

SOURCE: Technika lotnicza, no. 8, 1965, 205-213

TOPIC TAGS: heat transfer, supersonic flow, gas flow

ABSTRACT: This paper reviews the problems associated with the exchange of heat at supersonic speeds and very high altitudes. The following topics are discussed: The types of flow and their classification. Heat exchange in the flow of a continuous medium at high speeds. Temperature and velocity distributions on the wall of a body when the wall is isolated and when it is exchanging heat. Heat exchange in laminar flow and in turbulent flow around a body. Heat exchange in high-speed gas flows inside tubes. Heat exchange in dissociated gases (temperature dependence of the specific heat of air at a constant pressure, temperature dependence of air viscosity, temperature dependence of the thermal conductivity of air). Heat exchange in the adjacent layer to a wall (for the layer in equilibrium and for a "frozen" layer) for definite degrees of gas dissociation. Heat exchange at the point of pressure build up between an

Card 1/2

52

L 00045-66

ACCESSION NR: AP5021644

obstacle and dissociated air. Heat exchange in the flow of dissociated gases around a body. Heat exchange in rarefied gases (velocity and temperature distribution over a hot plate; variation of the mean free path of air molecules with altitude; slip flow; transition flow; free-molecule flow). Orig. art. has: 15 figures and 61 formulas.
